(OVERSEASE DEPT)

FAULAD INDUSTRIES was founded in 1968, with the aim & motto to serve the humanity honestly and professionally. The founder of the Company Mr. Bashir Ahmed Father of Mr. Muhammad Ashraf is the man who has been involved in the Dental Instruments Field for more than 30 years and is an authority in the manufacturing of all kind of Dental Instruments.

In 1994, Second Generation, Mr. Muhammad Ashraf took over the charge of the company as (CHAIRMAN) after the retirement of his father.

Now third generation Mr. Shahzaib head of USA office handling to all department for the Dental Supply in USA, and here in Pakistan Mr. Ali Saleh and Abdullah Ashraf manage to manufacturing Process for Dental Supply chain as per overseas buyers requirements.

The company is major manufacturing division to facilitate smooth functioning of the company, and each division is headed by a well qualified person having a vast experience of manufacturing & exports.

1. DENTAL INSTRUMENTS.

A key figure of aforesaid divisions is the Quality Assurance Manager whose main responsibility is to control and maintain the Quality of the products. He is also assisted by a well qualified staff capable of handling all the problems relating quality of products. Because of this high quality of workmanship, and untiring Endeavour, experience, technologies research of Mr. Muhammad Ashraf (CEO) we have gained and maintained a good reputation among our valuable customers.

We are holding **FDA, CE Marks Certificate, UAMED Certificate, ISO-9001-2008 & ISO 13485-2003 DCS CERT**, applies a quality system for manufactures and exporters of Dental Instruments.

We are very strict about the Quality of our products, bargaining may be possible on rates, freight and terms of payment, but there is no bargaining on **QUALITY** because,

"QUALITY IS OUR FIRST PRIORITY"

Our Scalers

Compare our scalers and curettes with the best in the industry and you will immediately recognize we are equal in every way but one... price. Note the deep precision knurling for better tactile feel. The same high-grade stainless steel tips, the same light weight (under 18 grams) for less hand fatigue, the same professional craftsmanship, and surpassing the highest industry standards. Of course, any manufacturer can make these claims, but we guarantee and certify ours.

Beautiful, blasted finish on center bar.
Deep cross-cut, knurling for better non-slip control.
Titanium coated color to protect the blood stains.
CNC machined for excellent balance, precision and consistency.
9.5 mm diameter for easier handling and better tactile sensitivity
Better comfort throughout the day.
Evenly balanced for consistent control when switching from tip to tip.
90 mm length - of handles without tips.

Dental Hand Instruments

The types of hand instruments can be categorized based on their function:

Examining the mouth and teeth Scaling or professional cleaning of teeth Cutting teeth and removing cavities Placing and condensing filling materials Carving and finishing dental fillings Miscellaneous types Instruments used for examining the mouth and teeth

Mouth mirrors are used to examine the condition of the teeth and mouth, as well as to retract the tongue and cheeks upon examination. Probes— There are many probes available but the main types are the straight probe, Briault probe and periodontal probe.

The straight probe is sharp and it is used to examine cavities in the dentine region as well as to check the margins of restorations or fillings. The Briault probe is also sharp and it is used to detect the junction between the enamel and dentine. Briault can also be used to detect tartar hidden in the gum pockets.

A periodontal probe can be used to measure the depth of the gum pockets and for other measurements. Instruments for cutting and scraping tissues and deposits

Scalers remove tartar (calculus) on the tooth surface as well as those hidden in the gum pockets. They can also be used to remove other surface deposits and temporary crowns.

Excavators are used to remove softened dentine and temporary fillings. The back of the blade can also be used for placing linings between filling materials. Sometimes excavators can be used for carving metal or amalgam fillings. Chisels are used to remove unsupported enamel during cavity preparation. Unsupported enamel can be harmful for it can compromise the longevity of the filling if not removed. Hatchets and hoes have similar purposes to chisels. Instruments used for placing and condensing filling materials Plastic instruments convey and shape filling materials and are usually flat blades that do not use heavy pressure.

Some instruments have rounded ends for shaping and burnishing the surfaces of fillings. Plastic instruments are usually made of stainless steel for most materials though there are also thin Teflon-coated or titanium nitride instruments which are non-stick for composite fillings. Condensers or pluggers are used for compressing and forming filling materials. Heavy pressure is applied on use therefore these instruments are usually used for metal or amalgam fillings. Instruments used for carving and finishing fillings Carving and finishing instruments have sharp or semi-sharp blades of various shapes. They are used to carve materials by cutting and scraping.

FD1-201 Dental Probe - Flexible Duple Ended SET OF 9 PCS.

Made of high quality stainless steel.
Designed to assess periodontal pocket depths, attachment levels, anatomy configurations and gingival bleeding. Measures the surface or pocket depth of the periodontic of each tooth. Working end has calibrated markings in millimeters.
Clinical probing depths and measurements of attachment loss obtained with periodontal probes are a practical and important method of determining a patient's periodontal status. When selecting a probe for measuring period depth, you should consider selecting a probe that has markings that you are familiar with. This section includes the most commonly used Probes.
Stainless Steel Material
Ultra-sonic Resistant
Completely Sterilizable
The thin, unflexible, yet flexible tips from a special steel alloy guarantee an extremely long life.
All our Periodontal probes are prepared by a high speed cutting machine.
Working parts are in very fine to very precise dimensions and the color markings are (fluent double or single) all-around resistant.

Gracey Curettes - Standard SET OF 9 PCS.

Gracey Curette Blade design is offset from the terminal shank at 70°.

This creates one cutting edge which is referred to as the lower edge.

Gracey Curettes are area specific to allow for deep scaling, root planning and periodontal debridement.

The offset blade provides a perfect working angulation for the tooth surface.

Gracey Curettes are used in a set to completely scale the dentition.

In the following chart you can find the exact application area for the various Gracey Curettes.

- Gracey 11/12
For all surfaces of the lower teeth and root surfaces.
- Gracey 13/14 & 15/16
For all surfaces of the lower teeth and root surfaces.
- Gracey 17/18 & 19/20
For all surfaces of the lower teeth and root surfaces.
- Gracey 11/12 & 13/14
For all surfaces of the lower teeth and root surfaces.
- Gracey 15/16 & 17/18
For all surfaces of the lower teeth and root surfaces.

INDUSTRIES

FD1-302 Gracey Curettes - Small SET OF 7 PCS.

The terminal shank of the Gracey curette Small is 3mm longer and the work endpieces are 50% shorter. This modification allows better access to the narrow root surfaces. A reduction in the widening of the gingival tissue when inserting the instrument is also an advantage of the shortened blade. Perfect for the front tooth region and for better access to all mesial and distal surfaces.

H6/H7 Hygienist Anterior Sickle Scaler

Super-thin, contra-angle design.
Very effective for Interproximal areas.
Shank angulation provides accessibility to all anterior and premolar surfaces.
Made with stronger and longer-lasting Stainless Steel

7/8 Younger Good Universal Curette

Blade designed with two cutting edges and a rounded toe for use on all surfaces.
Particularly use for the removal of supragingival / subgingival calculus.
Stainless steel.
Completely sterilizable
Super-durable to stay sharper longer.

13/14 Columbia Universal Curette DE

Anterior Columbia Universal Curette blade designed with two cutting edges and a rounded toe for use on all surfaces.
Use for side teeth and anterior tooth area.
Made from surgical grade stainless steel.
Large diameter handle design, 9.5mm
Completely sterilizable
Super-durable to stay sharper longer.

4R/4L Columbia Universal Curette DE

Posterior Columbia Universal Curette blade designed with two cutting edges and a rounded toe for use on all surfaces.
Use for the side teeth area.
Made from surgical grade stainless steel.
Large diameter handle design, 9.5mm
Completely sterilizable
Super-durable to stay sharper longer.

2R/2L Columbia Universal Curette DE

Anterior Columbia Universal Curette blade designed with two cutting edges and a rounded toe for use on all surfaces.
Use for the anterior tooth area.
Made from surgical grade stainless steel.
Large diameter handle design, 9.5mm
Completely sterilizable
Super-durable to stay sharper longer.

GF-3 Goldman-Fox Curette, DE

Super-thin, contra-angle design.
Same blade surface as GF-2.
Specifically designed for the proximal surface of the posterior teeth
Made with stronger and longer-lasting Stainless Steel

PR1/2 Perichard Periodontal Surgical Curette, DE

The Perichard Surgical Curette is a larger and heavier curette for the removal of granulation tissue and removal subgingival deposits. Curette is 7.5" long with 1.5mm wide working end on a 45 degree angle.

Made from surgical grade stainless steel for longevity and corrosion resistance.
Features a large diameter Stainless Steel handle for a more comfortable, controlled grip.

Langer Universal Curettes

The Langer Curette design combines the benefits of a Universal Curette blade, and the shank designs of area specific Curettes. A Universal blade allows Instrumentation on both the Mesial and Distal surfaces with one Instrument. The Gracey Style shanks allow adaptation on difficult Posterior Root surfaces. Suitable for scaling and Root planning and Periodontal Surgery. Langer Curettes have a thicker shank diameter that provides greater rigidity for Heavy calculus removal. Made from surgical grade stainless steel. Large diameter handle design, 9.5mm. Completely sterilizable Super-durable to stay sharper longer.

McCall Universal Curettes

Pointed McCall Curette designed for the removal of supragingival calculus. McCall scalers have tapered, pointed working ends and are highly suitable for interdental cavities. Made from surgical grade stainless steel. Large diameter handle design, 9.5mm. Completely sterilizable. Super-durable to stay sharper longer.

RESTORATIVE INSTRUMENTS

Dental Hand Instruments

The types of hand instruments can be categorized based on their function:

Examining the mouth and teeth Scaling or professional cleaning of teeth Cutting teeth and removing cavities Placing and condensing filling materials Carving and finishing dental fillings Miscellaneous types Instruments used for examining the mouth and teeth

Mouth mirrors are used to examine the condition of the teeth and mouth, as well as to retract the tongue and cheeks upon examination.

Probes— There are many probes available but the main types are the straight probe, Briault probe and periodontal probe.

The straight probe is sharp and it is used to examine cavities in the dentine region as well as to check the margins of restorations or fillings. The Briault probe is also sharp and it is used to detect the junction between the enamel and dentine. Briault can also be used to detect tartar hidden in the gum pockets.

A periodontal probe can be used to measure the depth of the gum pockets and for other measurements. Instruments for cutting and scraping tissues and deposits

Scalers remove tartar (calculus) on the tooth surface as well as those hidden in the gum pockets. They can also be used to remove other surface deposits and temporary crowns.

Excavators are used to remove softened dentine and temporary fillings. The back of the blade can also be used for placing linings between filling materials. Sometimes excavators can be used for carving metal or amalgam fillings. Chisels are used to remove unsupported enamel during cavity preparation. Unsupported enamel can be harmful for it can compromise the longevity of the filling if not removed. Hatchets and hoes have similar purposes to chisels. Instruments used for placing and condensing filling materials Plastic instruments convey and shape filling materials and are usually flat blades that do not use heavy pressure.

Some instruments have rounded ends for shaping and burnishing the surfaces of fillings. Plastic instruments are usually made of stainless steel for most materials though there are also thin Teflon-coated or titanium nitride instruments which are non-stick for composite fillings. Condensers or pluggers are used for compressing and forming filling materials. Heavy pressure is applied on use therefore these instruments are usually used for metal or amalgam fillings. Instruments used for carving and finishing fillings Carving and finishing instruments have sharp or semi-sharp blades of various shapes. They are used to carve materials by cutting and scraping.

PLOGGER FILLING INSTRUMENTS

Here we have a cavity that has destroyed a part of the tooth.

The cavity is removed with a drill and the site is prepared. Note that this preparation is smaller than the other methods of tooth restoration.

The preparation has a diverging shape towards the opening. A resin material is placed and packed in the prepared site.

The resin is then polished with polishing burs.

FD2-947

Technical Datas:

Intercondylar distance	120 mm.
condylar inclination	fixed at 30°
Bennet angle	fixed at 7°
Incisal table inclination	10°
Distance between mounting plates	110 mm.
Weight	700 gr.
Opening	180°

features:

Lightweight anathomic articulator made of aluminum die-casting. it can be used following the geometrical laws of medium values (Bonwill triangle). Fixing according to centric. Automatic return to the hinge axis with springs. Perfect stability also in reclused position. Easy access and visibility to the lingual surfaces. interchangeable self centring aluminum mounting plates.

FD2-948

Technical Datas:

Intercondylar distance	120 mm.
condylar inclination	fixed at 30°
Bennet angle	fixed at 7°
Incisal table inclination	flat
Distance between mounting plates	110 mm.
Weight	700 gr.
Opening	180°

Special Features:

Adjustable back by registration screw to work without incisal rod by keeping constant trajectories and inclinations during side and back/forward movements. Pure translation movement (key and instructions included). Anti-shock hinge rod in case articulator falls down. Bigger size lock screws for mounting plates.

Increased height and width

- (1) More space when using removable stumps systems.
- (2) More space for installation of mobile prosthesis with high chewing or big base.
- (3) More space when using magnetic plates

ENDOMICRO SURGERY SMALL KIT

Apicoectomy Treatment Stages:

Micro apical surgery by SE kit

Apical surgery is an option for the management of endodontically-treated tooth with persistent periapical lesions or symptom/sign. Several epidemiological studies have suggested that 33-60% of endodontically-treated teeth still presented the pictures of apical periodontitis. The possible causes may be persistent primary infection, secondary infection after endodontic therapy, vertical root fracture or coronal leakage. The success rate of apical surgery was reported to range from 37% to 91%. Complete apical healing had been observed in 37%-90% of the endodontically-treated teeth after apical surgery. The wide range and inconsistency of the results may be attributed to the variation in treatment planning, surgical technique, methodology, and follow-up period.

Patient presented with moderate pain on percussion related to tooth 22. Upon radiographic and clinical examination we've found an apical lesion related to this tooth with normal PDL probing. The patient has done the RCT 15 years ago with the full arch prosthetic crowns that looks fine and healthy. So we discussed with the patient the different treatment plans and we suggest the micro apical surgery to be done for more conservative approach rather than removing the crown, post, RCT, new post and new crown. The procedure was done in single visit compared to the multiple visits in the non-surgical approach. The patient was very happy for her smile, so she wants to keep everything as it is, this could be accomplished by the surgical approach as well.

FUNCTION OF ROOT ELEVATORS IN SURGERY

To Loosen Tooth or Root From Bony Socket Prior to Placement of The Extraction Forceps.

Dental Root Elevators

To look at one of these instruments you might mistake it for a narrow screwdriver.

That's because just like one an elevator has a handle and then a specially designed "blade" or tip portion.

How they're used.

The tip of an elevator is designed to be wedged into the ligament space between a tooth and its surrounding bone (as shown in our animation).

As the elevator is forced into and twisted around in this space, the tooth is rocked around and pressed against the walls of its socket.

This helps to both expand the shape of the socket and separate the tooth from its ligament.

As this work is continued, the tooth gradually becomes more and more mobile.

In some cases, the dentist may be able to completely remove the tooth just using their elevator.

If not, they will choose a point where they feel they have accomplished as much as they can with it and will then switch to using extraction forceps.

Function of Root Elevators:

To loosen tooth or root from bony socket prior to placement of the extraction forceps.

Bernard Root Elevators are particularly suitable for the excision of fractured roots or root fragments. They represent a combination of root tip elevators and luxating elevators. The inner side is concave and the lateral edges are for cutting. This allows for rotatory movements, and when applying slight pressure, the ligaments can be separated and the remaining root fragments can be loosened.

This section includes a set of five Bernard Root Elevators, including Left, Right, Straight, Mesial & Distal form. All elevators are made from Surgical Stainless Steel Hollow handle, light weight Completely Sterilizable

Bernard Root elevators also known as Syndesmotomes. They can also be used as Periotomes or to elevate Small Roots

Bernard Elevators -Syndesmotomes

Description:

The Luxator P-series offers good facility and reach with the penholder grip. These instruments are thinner and sharper than the original Luxator instruments. Initiating the extrusion process with the P-series range will simplify your work. Luxator P-series kit Contains 4 different blade shapes: FD4-415 Luxator P1, straight blade, dark green - Straight universal periosteum, ideal for anteriors and premolars. FD4-416 Luxator P2, curved blade, light blue - A slightly curved periosteum for improved ergonomics FD4-417 Luxator P3, contra angle blade, dark blue - Distal use, specially designed for use on posteriors. FD4-418 Luxator P4, dual edge blade, lilac - For fractured root tips and very decayed teeth

Extraction Forceps Function

Dental forceps are pliers-like instruments that are used to grasp teeth.

A dentist will usually have a number of different ones on hand, each having a design that's tailored to:

The specific shape of the tooth it's intended to remove (such as incisors vs. molars having two roots vs. molars having three roots).

The location of the tooth in the mouth (such as front vs. back, or left lower molar vs. right upper molar.) How they're used.

A dentist will grasp a tooth with their forceps and then firmly and deliberately rock it back and forth as much as it will.

Because the bone that surrounds the tooth is compressible, the socket will gradually start to expand.

As it does, the range of the dentist's side-to-side motions will increase.

In addition to this rocking motion, the dentist will also rotate the tooth back and forth.

This twisting action helps to rip and tear the tooth away from the ligament that binds it in place.

At some point, the socket will be enlarged enough, and the ligament torn away enough, that the tooth can be easily removed.

(Deep Gripe Extracting Forceps)

A-TRAUMATIC EXTRACTION FORCEPS

Improved tapered beaks for complete root contact.
Cross serrations for a never slip grasp.
Easily enter the sub gingival.

- No Fracture
- No Tissue Damage
- Extraction With Easy

THERMO PLIERS & MATHIEU NEEDLE HOLDERS

FD7-137
Hole Punch Plier
Creates half-moon cutouts in clear aligners to allow space for bonded buttons used for elastics

FD7-138
Vertical Punch Plier
This vertical plier emphasizes over-correction of rotations by creating an indentation at the facial and/or lingual of a specific tooth. Can also be used to create a rotational couple using vertical indents on facial and lingual surfaces on opposite sides of a tooth.

FD7-139
Tear Drop Punch Plier
Designed to create a notch at the gingival margin of clear aligners anywhere elastic hooks are required within the arch, making sure the elastic stays in place once the aligner is seated.

FD7-140
Horizontal Punch Plier
Designed to produce an indentation to accent individual root torque. Can also be used to enhance retention of clear aligner or retainers by placing an indent into a tooth's undercut or below a bonded attachment.

FD7-141
Dimple Punch Plier
Creates a tiny rounded dimple for spot contacts to accent individual tooth movements or added aligner retention. Typically used to accent movement on any tooth that requires a slight "nudge"

FD7-142
Eraser Plier
The eraser plier is designed to remove and flatten any unwanted indentations placed on clear aligners by other punch pliers.

FD7-143
Groove thermal forming plier
Designed for making grooves on clear appliances, to hold the elastic, prevent it falling off

FD7-144
Thermoplier Micro-Ramp Pliers
Tip, torque or rotate smaller teeth laterally. Allow contact close to incisal edge. On the correct location on the target tooth

FD7-145 © Pink
Thermoplier Small Circle Pliers

DENTAL IMPLANT INSTRUMENTS FUNCTION

Instruments for dental implants are made of high quality stainless steel.

Our line of instruments include, but is not limited to, the following products:

Bone Grafting Instruments

- Bone Curettes (SPRATT) – designed for harvesting bone
- Bone Grinder – used in conjunction with a mallet to grind bone into appropriate particle sizes
- Bone Basin – weighted bottom design prevents tipping or spilling while mixing bone or other bone grafting materials
 - Bone Compactors – feature serrated tips for compacting bone
- Scalpels – offers convenience of a disposable with razor sharp cutting edge for superior cutting
- Biopsy Punches – designed at a steeper angle to ensure a finely honed, sharper edge
- Bone Spreading Chisels
- Freer Chisels – double or single cut tips used for widening ridges during implant preparations
- Graduated Chisels – feature reference markings for measurement during a bone ridge augmentation and are available in straight and curved patterns

Osteotomes

- Concave Osteotomes – break the floor of the maxillary sinus through the implant cavity and are available in curved (off set) and straight (with or without stops)
- Convex Osteotomes – raise the floor of the maxillary sinus and are available in curved (off set) and straight patterns (with or without stops)
- Progressive Osteotomes – designed to prepare the implant site in the maxillary area where bone density is 3 or 4
- Bone Spreading Osteotomes – sharp or blunt configurations for progressive circumferential expansion of the implant site

Sinus Lift Instruments

- Sinus Lift Curettes and Elevators – lightweight, wide diameter stainless steel hand instruments lift the sinus membrane for bone augmentation procedures

Gauges & Calipers

- Gauges & Calipers – various measuring devices available to determine appropriate length, width, and distance for implant procedures

Collagen Products

- Collagen wound dressing product offering includes products.

Sterilization Trays

- Sterilization Trays – designed to protect and store instruments during sterilization, transportation and storage

With curette the sinus membrane is further detached over a broad area in the inner region, especially along the roof of the palate.

The "Schneider's Membrane" of the sinus can be detached with curette by 1-2mm along the total cortical bone.

Curette is particularly useful in the lower part for detaching the membrane further. The same goes for the caudal area, especially when the membrane is 4-5 mm above the base of the maxillary sinus and the maxillary sinus is built up with granular material.

Curette makes it possible to lift the membrane further in mesial region. One working tip is especially designed for the right maxillary sinus and the other for the left maxillary sinus.

With curette the sinus membrane is further elevated in the upper and posterior part of the maxillary sinus wall.

SINUS INSTRUMENTS SET OF 10 PCS

Flexible Sinus-Lift Curettes – for an optimum sensitivity during the direct lift procedure
The perforation of the Schneiderian membrane is a complication that often occurs during a maxillary sinus floor augmentation procedure. The Sinus-Lift Instruments increase the sensitivity by blunt and flexible working tips with "Swing-Effect". Because of their special shapes and the characteristic of the stainless steel between the handle and the active part, light pressure is cushioned and gives the operator a direct and sensitive response. At the same time the risk to perforate the Schneiderian membrane is reduced to a minimum. Already at the development the focus was a predictable handling. Because of varying angulations and shapes of the active parts also in difficult areas they are easy to navigate also in difficult areas. The line of curettes consists of six different figures for every situation. They are complemented by spoon and condenser to place the bone graft.

Curette is particularly useful in the lower part for detaching the membrane further. The same goes for the caudal area, especially when the membrane is 4–5 mm above the base of the maxillary sinus and the maxillary sinus is built up with granular material.

VISTA Tunneling Set

VISTA Tunneling Set
FD8-232

Vestibular Incision Subperiosteal Tunnel Access (VISTA). Progressive apical displacement of gingival tissue away from the CE results in gingival recession and root exposure. The clinical consequences include root sensitivity, root caries, cervical root abrasions, inadequate plaque control, and aesthetic concern.

The Vestibular Incision Sub Periosteal Tunnel Access (VISTA) is among the documented surgical treatments of gingival recession. Its advantages include minimizing surgical trauma, maintaining better blood supply, preserving papillary integrity, reducing tissue refraction, absence of scar tissue and excellent root coverage.

VISTA technique improves biotype. It successfully treats multiple recession defects. It avoids some of the potential complications of intrasulcular tunneling techniques.

Titanium Nitride (TiN) black coated working points provides optimal edge retention, reduced light reflection and enhanced contrast and visual acuity at the surgical site and underlying tissue.

Large diameter handle (9.5mm) for enhanced ergonomics, tactile feel and optimal clinical performance. Longevity and corrosion resistance afforded by handcrafting from the finest grade surgical stainless steel. Completely Sterilizable.

BONE GRAFT INSTRUMENTS

Dental Bone Graft

Step 1
Extraction of natural tooth

Step 2
Debride Extraction site

Step 3
Place Graft material

Step 4
Place protective membrane

Step 5
Close tissue and place sutures

Bone Grafting is a complex and risky procedure and it sometimes get infected while healing. The dental bone graft cost also expensive. So DeMotivate comes up with a new technique called Permanent teeth in 3 days without Bone Graft procedure.

In micro surgery, Tunneling Instruments find their application in the preparation of lips or subsequent reconstructions of the alveolar ridge or for root coverings with a connective tissue graft. This tunneling instruments set allow a minimally invasive tunneling preparation to avoid large openings. Due to the fine shaped raspatories tunneling incisions in the tissue are possible.

The modified instruments curved beyond the working tip allow even better access, especially in the posterior tooth region. A user can select the ideal instrument for his/her purposes.

This set includes the Micro Surgical Needle Holder & a Micro Surgical Tissue Plier, both have fine Diamond Busted working tips. A perfect set for surgical and tunneling procedures.
